

Level 1: Beginner – Submission Report

Project: TaskFlow – Full Stack Task Management System

Organization:	Cognifyz Technologies	Domain:	Full Stack Web Development
Status:	Completed & 100% Verified	Author / Intern:	Full Stack Intern (vikast2849)
Tasks Included:	Task 1 & Task 2	Repository:	github.com/vikast2849/taskflow

1. Level Overview & Objectives

- **Task 1 (HTML Structure & Basic Server Interaction):** Semantic HTML form submission via HTTP POST, Express URL-encoded body parsing, and Server-Side Rendering (SSR) using EJS templates.
- **Task 2 (Inline Styles & Dual Validation):** Extended form attributes (Title, Description, Priority enum, Due Date), real-time client JavaScript validation, strict server validation returning HTTP 400 with preserved input, and temporary server-side storage.

2. Route Endpoints & Verification URLs

- **Task 1 View & Submission:** /tasks/task-1 – Serves form via GET, processes creation via POST and renders submitted task with EJS.
- **Task 2 View & Validation:** /tasks/task-2 – Serves extended form via GET, performs dual validation and stores records in temporary memory via POST.

3. Implementation Files & Technical Architecture

Component / File Path	Key Technical Functionality
server/controllers/task1Controller.js	Express POST body parsing and dynamic EJS SSR task creation.
views/tasks/task-1.ejs	Semantic HTML form and server-rendered dynamic task card.
server/controllers/task2Controller.js	Field length and enum server validation with temporary in-memory store.
public/js/task2-validation.js	Client-side interactive validation preventing invalid form submissions.
views/tasks/task-2.ejs	Form with inline styles, error message containers, and live storage list.
tests/test_task1.js	Automated end-to-end test script verifying Task 1 routes (HTTP 200, 201, 400).
tests/test_task2.js	Automated test script verifying Task 2 validation and temporary persistence.

4. Submission Summary for Internship Portal

Cognifyz Level 1 (Beginner) Submission:

- Completed Tasks 1 & 2 in full compliance with Cognifyz internship guidelines.
- Built client-server communication using Express body-parsing and EJS SSR.
- Implemented dual-layer (client & server) validation preventing malformed data entry.
- Verified with automated tests (test_task1.js and test_task2.js passed with code 0).
